PROFILE

Journalism-trained software engineer building full-stack, AI-enabled products that make complex public data legible. Technical lead and primary builder across civic-data, AI decision-support, and emergency-routing systems — owning products from architecture and data pipelines through testing, deployment, and iteration.

TECHNICAL SKILLS

Languages: TypeScript, JavaScript, Python, SQL, HTML/CSS

Frontend: React, Next.js, Vite, Astro, Tailwind CSS

Backend / Data: FastAPI, Node.js, Express, PostgreSQL, PostGIS, Supabase, REST APIs, Auth

AI & Cloud: Anthropic API (Claude), Docker, Google Cloud Run, Vercel, Render

Testing & Tooling: pytest, Vitest, Testing Library, Jest, Cypress, Git/GitHub

EXPERIENCE

Pursuit — AI-Native Software Engineering Fellow

Jan 2026 – Present

Built a drift-proof evaluation harness for an AI customer-inbox-triage tool — single shared inference path, automated CI gate, serverless proxy layer, and PII redaction — reaching 8/8 accuracy on urgency and category classification.

Elite Global Cleaning Services — Freelance Full-Stack Developer · [Live](#)

Nov 2024 – May 2025

Sole technical point of contact: shipped a multilingual (EN/ES) Astro/TypeScript site with React integrations, customer contact flows, SEO, and performance optimization. Still provide occasional maintenance.

Women's Health Pavilion — Front Desk Coordinator

Sep 2024 – Present

Coordinate scheduling, patient intake, insurance/authorizations, chart readiness, and cross-department issue resolution, proactively closing workflow gaps during frequent short-staffing.

SELECTED ENGINEERING PROJECTS

[Sano](#)

2026

A Next.js/TypeScript product that surfaces what NYC restaurant letter grades hide — inspection trajectory, volatility, and repeat violations — through timelines and history-aware scoring. Engineered the Python ingestion, normalization, scoring, and validation pipeline over NYC DOHMH data on Supabase/PostgreSQL, with Google Places enrichment, provenance checks, and resilient JSON fallback.

[CarbonShift](#)

2026

A civic climate-intelligence platform answering, per building, “Is this NYC building exposed to carbon fines, compliance risk, or retrofit pressure — and why?” Migrated SQLite → PostgreSQL/PostGIS; ingested NYC building records, violations, footprints, and asbestos projects; filled coverage gaps by pulling footprints from an ArcGIS FeatureServer where the Socrata dataset was ~18% complete; shipped scoring pipelines, a MapLibre map with real footprints and CSV export, and a hardened Flask JSON API on Supabase.

[Vantage](#)

2026

A TypeScript tool that turns disparate conflict-intelligence data into real-time visual situational awareness for journalists and analysts, with Claude-powered analysis. Architected a pnpm workspace with modular shared-logic separation; containerized via Docker; deployed on Vercel.

[Nightfall](#)

2026

Brought the concept and PRD, then built the working prototype solo — geospatial blast-zone routing combining location, weather, and fallout-decay logic — and handed off the full codebase and docs to a hackathon team who deployed their own versions. Won Community Favorite and Best Alignment with Theme among 40+ participants.

EDUCATION & TRAINING

Pursuit — Advanced Software Engineering Immersive2023 – 2024

City College of New York — B.A. Journalism & Politics2021
